## Y SOFT IN LOGISTICS

---

We all rely on transportation and logistics for obtaining and distributing products and goods around the globe. This backbone sector of society has a huge responsibility. From inbound and outbound transportation management, fleet management, warehousing, materials handling, order fulfillment, logistics network design, inventory management, supply, and demand planning, this is a busy and critical service provider. From ordering, processing, through to receipt, there are many different elements to be dealt with.

### CHALLENGES

---

This sector has experienced an unprecedented increase in demand in recent years thanks to online shopping and home delivery, not to mention the global pandemic. This increase has led to more pressure to deliver within tight timeframes and at low costs. Frictionless logistics is vital for the flow of goods; timing is everything. Documents play a vital role in logistics operations, including labels and details for incoming and outgoing shipments, barcodes, shipping notes, inventories, rotas, receipts, and so much more. The challenge is to print and access these in real-time while preventing downtime, disruptions, delays, and security breaches. One additional challenge for this sector is sustainability. As a sector, contributions to global emissions are recognized as high, so there is a drive to support sustainable goals where possible.

## BENEFITS

---

Streamlining processes, improving productivity, reducing costs, availability, and supporting green initiatives, YSoft SAFEQ is the print management solution for the logistics industry.

### **Compliance & security**

Compliant with industry standards around the world, SAFEQ's enterprise-level security features protect confidential documents. Authentication keeps print jobs stored in a secure personal print queue until the user releases the job at the printer. Improving visibility and control, fact-based reports provide an audit trail on all print services activity. This shows who is printing what, where, when, and how. Password-protected PDF files provide additional security on financial or client documents and information. Additionally, documents can be restricted with security clearance levels, with print access only available to a specific band of individuals.

### **Cost savings**

Fact-based reports can accurately track usage, providing accurate insights to make changes to reduce print costs. SAFEQ's unique building block architecture reduces server needs and related costs. Setting predefined print rules can enforce savings, for example, printing in duplex, or black and white.

### **Green initiatives**

From using workflows and digitizing documentation to enforcing double-sided printing to reduce paper consumption, YSoft SAFEQ can help the industry reduce its carbon footprint. Green reports supply sustainability initiative data and highlight the usage of key resources, such as water, timber, and CO2 emissions. These reports can be used to identify areas where waste and associated environmental impact.

### **Efficiency and productivity**

Easy-to-use automated scan workflows saves time. There is no more waiting for staff to collect or deliver documents between offices, departments, or buildings. Removing the risk of human error, documents can be distributed and named according to predefined naming conventions and destination. Automatic detection of scanned documents using bar codes and OCR supports digital transformation goals and creates new efficiencies. Advanced scan workflows create scan that are keyword searchable and editable.

### **High availability**

When printing is a critical business process, a delay in printing can be catastrophic. High availability features such as redundancy and failover ensure that printing continues; additionally, high availability can be employed in only those offices that have a critical need.

### **Flexible & simple**

Receiving and printing documents is an efficient and quick task with SAFEQ. The solution is as easy for the IT team to deploy and manage as it is for the users. Mobile printing supports use on the move. Whether in the warehouse, sorting center, back-office, or on delivery – you can print to wherever you need it.
